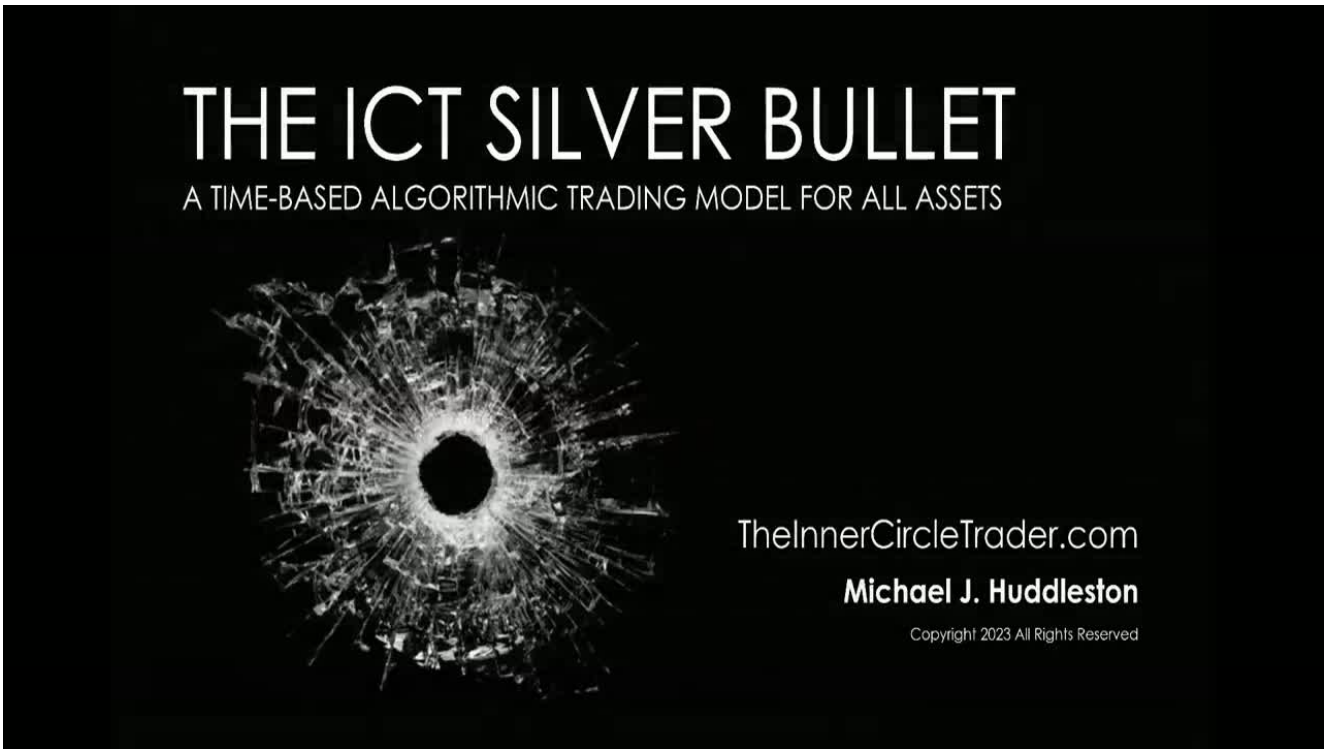
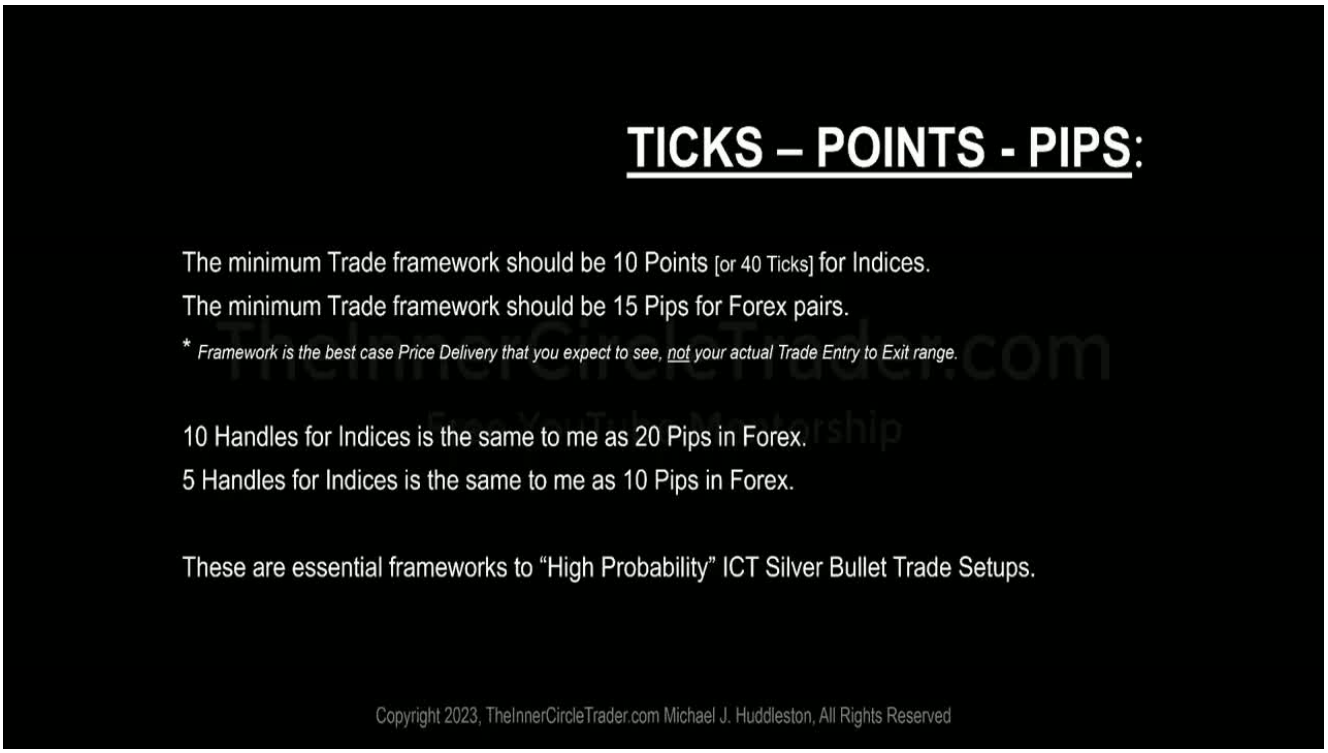
TIMEMARK: 00:00:06,759



Welcome back. This session will detail the ICT Silver Bullet trade setup, which operates as a time-based algorithmic trading model.

[Cont.]: This segment will provide a comprehensive explanation of ticks, points, and pips, clarifying their specific relationship and application within the Forex market.

TIMEMARK: 00:00:33,520



When executing an ICT Silver Bullet trade involving futures, the minimum profit objective for index futures should be 10 points or 40 ticks.

[Cont.]: Concerning indices, the minimum trade framework for Forex traders should be 15 pips. To elaborate,

[Cont.]: This framework outlines the best-case price delivery expected within the market. It is critical to distinguish this concept from your actual trade entry and exit range.

[Cont.]: Even in a hypothetical scenario where every market condition aligns perfectly, it is imperative for traders to recognize that the objective is not to achieve a flawless trade entry. Successful trading does not necessitate absolute perfection regarding entry points; rather, it emphasizes strategic execution based on a well-defined plan.

[Cont.]: It is recommended to exit your position once the complete projected price movement, anticipated within the specific trading range of the asset class you are trading, has fully materialized.

[Cont.]: This framework provides the foundational structure for analysis. Within this established methodology, traders should focus on identifying trade setups that do not necessitate the highest degree of precision or complex interpretation for successful execution.

[Cont.]: Proficiency in both entry and exit precision will naturally develop over time. However, when leveraging a structured trading model, the objective is to achieve and consistently maintain a refined level of precision in execution.

[Cont.]: When trading index futures or other indices, it is beneficial to utilize a more adaptable framework. This framework, at a minimum, must inherently offer the potential for favorable results.

[Cont.]: When establishing profit targets for certain instruments, a typical objective is 10 points or 10 handles. This measurement is equivalent to 4 ticks.

Applying this framework to the Forex market, the recommended minimum profit target for a given currency pair should be at least 15 pips.

[Cont.]: When evaluating a potential trade, if one cannot identify or project a price movement of at least 15 pips within the anticipated range, the trade setup likely does not possess a high probability of success.

[Cont.]: It would be more appropriate to disregard the current trading setup and seek alternative opportunities. From my perspective, a 10-handle target for indices is equivalent to a 20-pip target in the forex market.

[Cont.]: For indices, a five-handle price change is analogous to a 10-pip movement within the Forex market. This comparison frequently arises in discussions and inquiries from individuals engaging with my content on social media platforms or in video comments, as they often seek to understand such relative valuations.

[Cont.]: Individuals frequently contact me through TradingView's messaging system. However, I generally do not respond to the majority of these messages, given the high volume of inquiries received.

[Cont.]: A frequently asked question recently pertains to whether my primary instructional focus is predominantly on...

[Cont.]: During the 2023 free YouTube mentorship series, a recurring question often addresses specific price targets. For example, a common inquiry is whether one should aim for a five-handle price movement in the E-mini S&P 500 futures contract.

[Cont.]: For those trading forex, a 10-handle target in the mini S&P is directly comparable to seeking a 10-pip movement.

[Cont.]: For traders focused on indices or stock index futures, a comparable target metric is typically observed. For Forex traders, the equivalent objective would be to secure approximately 20 pips within their selected currency pair. This approach helps establish a clear profit target for the trade.

[Cont.]: The relationship between these two elements establishes essential frameworks for what I identify as a high-probability ICT Silver Bullet trade.

TIMEMARK: 00:03:47,519

This section will delve into the types of ICT Silver Bullet setups, which represent a crucial element of this presentation. We will meticulously examine their fundamental framework.

TIMEMARK: 00:03:58,040

ICT Silver Bullet setups commonly feature a draw on liquidity from the previous day's high or low. It is important to note that this represents a frequently observed scenario and is not an exhaustive definition of all possible Silver Bullet configurations.

[Cont.]: In a bullish market condition, yesterday's high often represents a significant level where buy stops and buy-side liquidity are resting. Therefore, a primary objective would be to observe price execute a run towards this previous high, aiming to capture the available liquidity.

[Cont.]: When a market exhibits expansion towards a day's high, this movement typically acts as a draw on buy-side liquidity. Conversely, if we hold a bearish bias and anticipate lower prices throughout the week, we would expect to see expansion towards a low, which in turn draws in sell-side liquidity.

*[Cont.]: The previous day's low is identified as containing significant **sell-side liquidity**, primarily consisting of accumulated stop-loss orders. Consequently, our objective is to locate potential trading **setups** that suggest an imminent price expansion targeting and moving into this designated liquidity pool.*

[Cont.]: Liquidity pools are frequently found at previous session highs and lows, which act as significant draws on liquidity. To illustrate, imagine you are analyzing the charts during the AM session.

*[Cont.]: During the New York trading session, a key area of focus involves the high and low points established during the preceding London session. Traders would anticipate either a **run on liquidity** targeting these extremes or a retest of these significant price levels.*

*[Cont.]: Previous weekly highs and lows are critical reference points, often acting as significant draws in **liquidity**. When anticipating a bullish market, traders should look for price to run above the prior week's high, targeting the accumulated buy-side **liquidity**. Conversely, in a bearish scenario, the expectation would be a run below the previous week's low, aiming for sell-side **liquidity**.*

[Cont.]: To identify potential draws on liquidity, traders should observe two key scenarios. The first involves a price run below the previous week's low. The second scenario occurs when price returns to a current or older New Week Opening Gap. Both instances are considered significant areas of attraction for price.

[Cont.]: The market typically exhibits either a liquidity grab or an expansion away from the current or a previously established New Week Opening Gap. This price action often converges with a classic ICT Optimal Trade Entry, a historically consistent and highly effective trading setup.

[Cont.]: While establishing content for this YouTube channel, a particular trading setup was always considered the classic Flagship pattern. However, with the subsequent introduction of numerous additional models and approaches, it cannot be referred to as...

[Cont.]: The Fair Value Gap (FVG) has ascended to become the principal flagship pattern, superseding previous focal points. This elevated importance of the FVG is particularly evident within the confluence of the 2022 ICT Mentorship YouTube model, a comprehensive framework I developed and presented.

[Cont.]: The comprehensive educational content, encompassing critical ICT concepts, is made freely available on this YouTube channel. In the context of identifying your 'draw on liquidity,' particularly during a bullish market phase, this objective typically materializes as an inefficiency located above the current market price.

[Cont.]: When operating with a bearish market bias, any existing inefficiency located below the current price often serves as a potential draw on liquidity. This suggests that if our directional outlook is bearish, price may seek to fill such an inefficiency, potentially reaching a discount level where a tactical 'discount buy' could be considered. Concurrently, the presence of sell-side inefficiencies, such as bearish Fair Value Gaps (FVGs), provides additional structural context for potential short opportunities.

[Cont.]: When operating with a bearish bias, an identifiable Fair Value Gap (FVG) situated below the current price action would represent your anticipated target or "draw on liquidity." Conversely, for a bullish bias, one would typically seek a Fair Value Gap positioned above the current price action.

[Cont.]: An inefficiency often exists above current price action, which typically manifests as a Fair Value Gap (FVG) or, more specifically, a Sell-Side Imbalance, Buy-Side Inefficiency (S.I.B.I.).

[Cont.]: A Value Gap is identified above the current price action. This particular Value Gap, along with all previously discussed equivalent market structures, should be considered equally viable for analysis and potential strategic consideration.

[Cont.]: When assessing market probabilities, it is crucial to recognize that not all identified factors will actively influence the market simultaneously. However, there will be specific instances where elements such as the previous week's High hold significant importance.

[Cont.]: If a specific market condition or price level has already been thoroughly evaluated earlier in the trading session, revisiting it for further analysis may not be the optimal strategy. Consequently, it often proves more beneficial to elevate your perspective by examining a higher timeframe.

[Cont.]: For a bullish market outlook, potential targets include a timeframe-specific Liquidity Pool or an Inefficiency situated above the current price. While numerous such scenarios could be detailed, [the original transcript ends abruptly here, suggesting a continuation or shift in focus].

[Cont.]: This curated list is designed to provide the students on my YouTube channel with substantial analytical latitude, empowering them to thoroughly examine and interpret market dynamics.

[Cont.]: The complete range of these specific market situations will not always manifest simultaneously on any given trading day. However, it is common to identify at least one of these high-probability setups within the charts on most trading sessions.

[Cont.]: These criteria will invariably be in play. However, do not simply accept this assertion without verification. As we proceed to analyze the price action, you will unequivocally observe the validity of my statements.

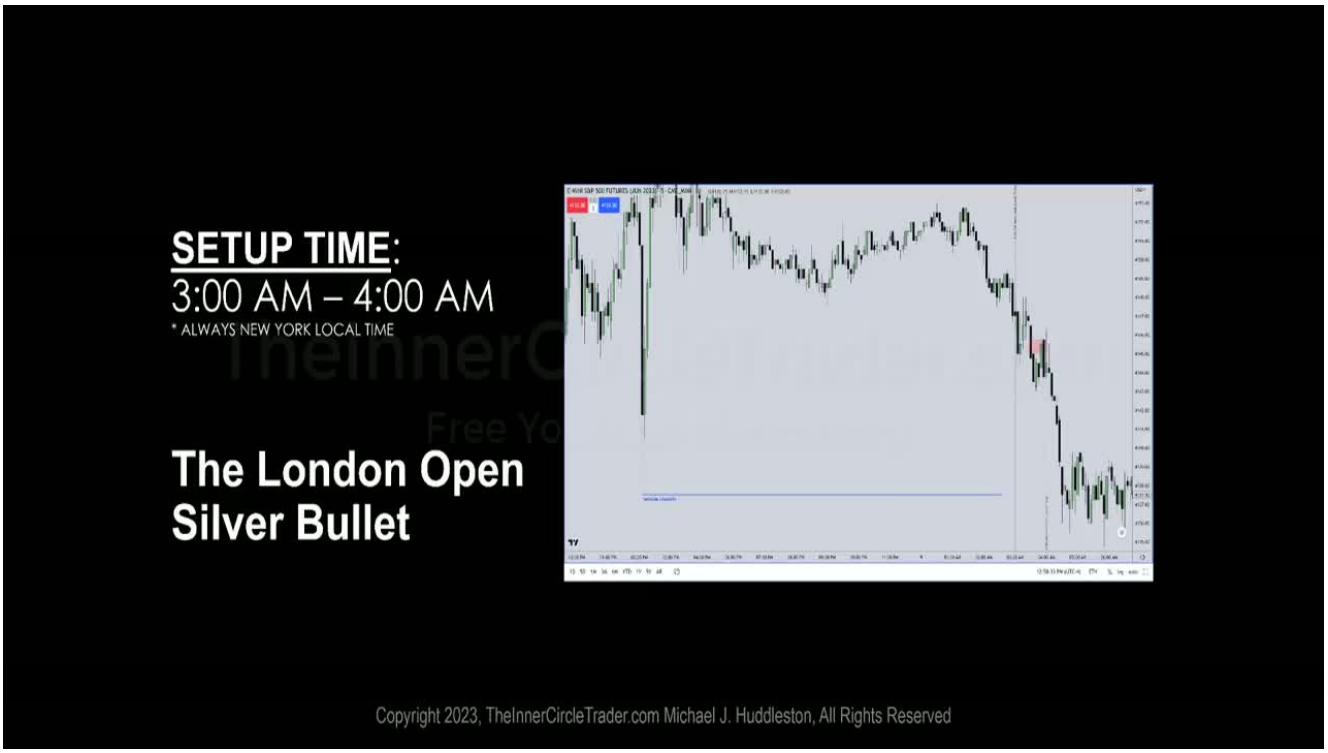
[Cont.]: The primary objective is to determine the next most probable draw in price action, identifying where price is likely to gravitate.

[Cont.]: A fundamental goal for all my students is to first prioritize the development of essential trading skills. This is because the precise mechanics of entries and exits are, comparatively, the least critical aspect of successful trading.

[Cont.]: Understanding price's intended direction is fundamental when analyzing charts, irrespective of the specific analytical concept being employed.

[Cont.]: Trading without precise timing often leads to unsuccessful outcomes. This session will delineate the foundational ICT Silver Bullet setup, emphasizing the critical role of its formation time. It is imperative to understand that this specific setup is intrinsically time-dependent.

TIMEMARK: 00:08:21,120



This model posits that specific market dynamics are intrinsically linked to a precise 60-minute interval or window within each trading day. Consequently, a particular pattern is expected to form during this defined timeframe. However, its exact manifestation or the outcome it produces may not always be identical.

[Cont.]: The specific market condition or pattern being discussed may not always manifest within the particular Forex Pair you are trading. Similarly, it might not be evident in the Futures Contract you are monitoring, nor in the specific asset you are currently analyzing.

[Cont.]: This particular trading setup reliably forms on a daily basis. The initial window for this setup occurs between 3:00 AM and 4:00 AM. It is imperative to note that all time references, especially when specific times are mentioned, are consistently based on New York local time.

[Cont.]: For all timing references, whether they represent a specific window or an exact moment during the trading day, it is crucial to ensure your charting platform is accurately calibrated to New York local time.

[Cont.]: To accurately establish the timing pertinent to your specific geographical location and operational window, meticulously observe Daylight Saving Time if it is currently in effect. This practice is fundamental to eliminating any temporal ambiguities.

[Cont.]: When charting, it is imperative to use the local New York time. This specific time zone serves as the standard for analysis and identifying high-probability setups, particularly for models like the London Open Silver Bullet.

[Cont.]: For the Silver Bullet setup, we are specifically looking for a classic ICT Fair Value Gap (FVG) that forms between 3:00 AM and 4:00 AM New York local time.

TIMEMARK: 00:09:41,880

In your analytical approach, the paramount factor you will heavily rely upon is the refined skill set for accurately anticipating future price direction.

[Cont.]: The primary consideration should not solely revolve around establishing a directional market bias. Instead, the predominant focus must be on identifying the next draw on liquidity. This involves determining where liquidity resides, specifically whether it is located above the current market price.

[Cont.]: In a bullish market scenario, price action typically targets buy stops or moves to fill inefficiencies residing above the current market price. However, in this particular instance, the market demonstrated a clear bearish bias, indicating an expectation for further downward movement.

[Cont.]: Analysis identified a distinct sell-side liquidity pool situated beneath the previous swing low. Subsequently, during the period between 3:00 and 4, the market's price action resulted in the creation of a Fair Value Gap (FVG).

[Cont.]: A significant shift in market structure was observed below the designated low, following a preceding price gap. This price action configuration represents a classic Optimal Trade Entry (OTE), further characterized by the presence of a Fair Value Gap (FVG) within the relevant price range.

[Cont.]: Price action indicates strong support, with candlestick bodies consistently holding within the identified Gap. At 4:00 AM, price initiated one final upward thrust, briefly extending just above the Gap's boundary.

*[Cont.]: Adherence to the established rules within my comprehensive suite of trading models would have consistently prevented a stop-out in this specific market scenario. This principle is particularly applicable when utilizing the **Op Trade Entry** methodology. The fundamental objective for this approach is to systematically identify and analyze key market conditions.*

[Cont.]: This analysis pertains to a Futures Contract. The fundamental question is whether this specific market offers the potential for a minimum gain of 10 handles.

[Cont.]: The anticipated market trajectory suggests a price movement extending below a defined low. This projection implies not merely a retest of that low, but a decisive breach through it. Therefore, it is reasonable to anticipate a potential downward price expansion of 10 handles.

[Cont.]: A short entry is executed within a Fair Value Gap as part of the ICT Silver Bullet formation. This specific entry must be taken inside its designated 60-minute trading window.

[Cont.]: The designated period between 3:00 a.m. and 4:00 a.m. does not mandate that a trade, once entered, must also be exited within that same 60-minute window.

[Cont.]: Trades may frequently extend beyond 4:00 AM and into 5:00 AM, potentially continuing until the opening of the New York session.

[Cont.]: While market participants often observe significant movements or setups between 7:00 and 8:00 AM New York local time, in this particular instance, our primary objective would be to target this specific low and the sell-side liquidity resting beneath it.

[Cont.]: The trade entry was established, targeting a minimum of five handles in profit. This initial objective was successfully met. The subsequent analysis, within our trading framework, then assessed the potential for a further extension to a ten-handle profit target, which was ultimately achieved.

[Cont.]: The ICT Silver Bullet is a trading strategy that involves shorting into a Fair Value Gap (FVG). This specific setup targets a minimum profit of five handles, with the position typically covered at a preceding old low.

[Cont.]: This framework represents my personal trading model developed for my son, Cameron. Continuing our detailed series on Silver Bullet setups, the AM session model is now introduced as the second configuration.

TIMEMARK: 00:12:41,320

Our analysis centers on the 10:00 AM to 11:00 AM New York local time window. Specifically, we are observing the E-mini.

TIMEMARK: 00:12:53,480

For the S&P, the strategy involves observing the market between 10:00 a.m. and 11:00 a.m. New York local time. During this specific window, under bearish market conditions, we anticipate price targeting relative equal lows, which indicates a sell-side liquidity sweep.

TIMEMARK: 00:13:06,800

Below a significant price level, **sell-side liquidity** is observed. In conjunction with this, a **bearish Fair Value Gap** is identified. The market subsequently trades up into this **bearish Fair Value Gap** during the 10:00 AM to 11:00 AM optimal trading window. This confluence presents a high-probability opportunity for a short sell entry.

[Cont.]: A 10-handle price movement was observed, extending from approximately 4146 to 4136. This particular range does not reach the designated low, nor does it breach the subsequent lower level. Consequently, this movement definitively satisfies the established criteria.

[Cont.]: The current market framework indicates a minimum potential price movement of 10 Handles. It is crucial to understand that this does not imply an objective to secure precisely 10 Handles, but rather that the specific trade setup offers at least 10 Handles of potential range. Consequently, initiating a short position at this juncture allows for the potential collection...

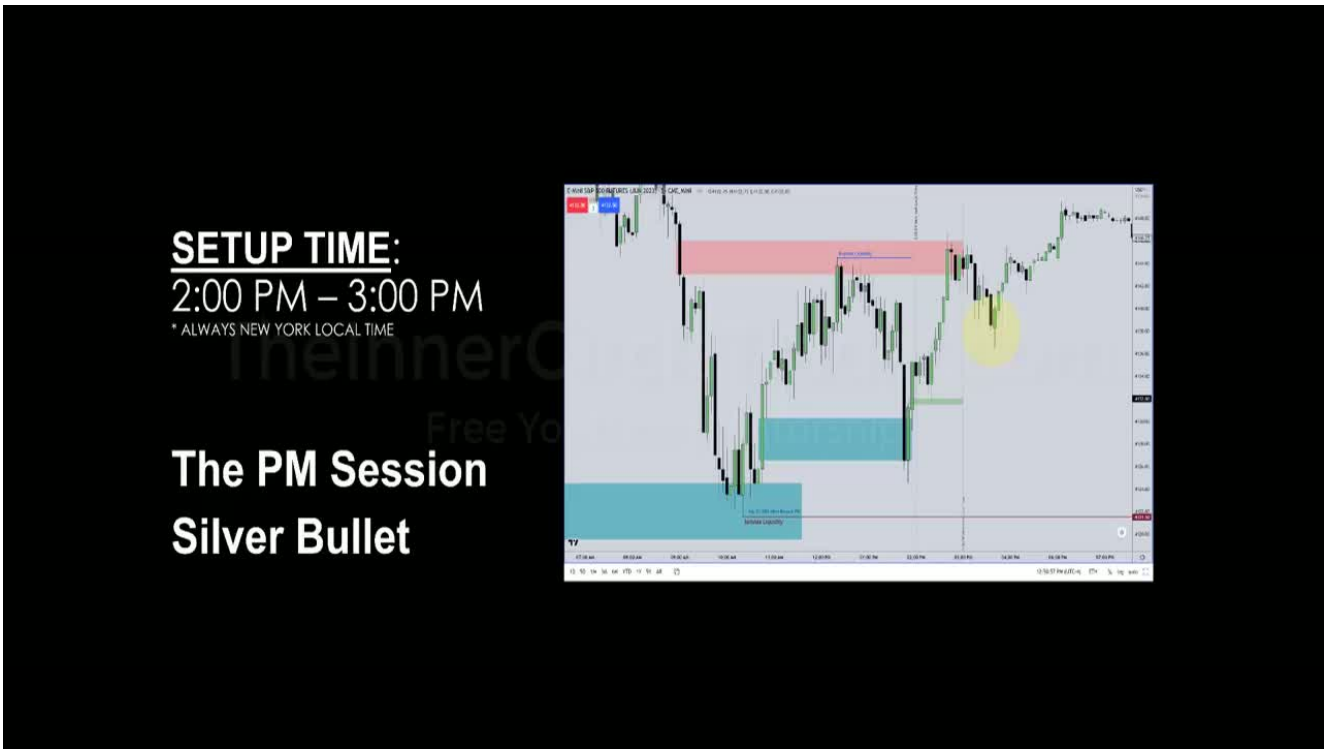
[Cont.]: A potential gain of five handles was achievable within the 60-minute timeframe. It is crucial to understand, however, that consistently aiming for this specific outcome is not the primary objective, as I previously explained.

[Cont.]: Trades are often held for a duration that extends beyond the specific analytical window from which the trade framework and entry were derived. Consequently, these are not intended to be quick, in-and-out trades completed within the same trading session.

[Cont.]: During this specific hour, the objective is to identify a developing trade setup that facilitates entry within the 10:00 AM to 11:00 AM timeframe.

[Cont.]: Finally, the last ICT Silver Bullet is identified, framed within the 2:00 p.m. to 3:00 p.m. local time window.

TIMEMARK: 00:14:19,560



This segment examines a PM session ICT Silver Bullet setup, observed during New York local time trading hours. Specifically, price was seen trading down into a higher time frame.

TIMEMARK: 00:14:31,480

We observe a 15-minute Discount Fair Value Gap. Participants are encouraged to verify this specific market condition on their own charts. Subsequently, the market trades down into this Fair Value Gap, followed by a noticeable shift in market structure.

[Cont.]: When a swing high is broken to the upside, it signifies a shift in Market Structure. This often leads to the formation of a Fair Value Gap (FVG). Subsequent retracements back into this FVG should be observed for potential trading opportunities.

[Cont.]: In technical analysis, while candle wicks often illustrate temporary price excursions or "damage" beyond a specific level, it is the candle bodies that ultimately define and communicate the prevailing market narrative. The true story of price action, and the sustained sentiment behind it, is predominantly conveyed by where the bodies close relative to their opening, providing the essential context for market interpretation.

[Cont.]: Price demonstrated respect for a significant Fair Value Gap (FVG), an area indicative of body balance efficiency, as it approached the 2:00 mark. Following this, the market initiated a rally, subsequently forming a new, smaller Fair Value Gap. This upward movement was then succeeded by a market decline.

TIMEMARK: 00:15:07,600

Following an initial movement, price often seeks an optimal entry point within a discount array or specific price level. From this area, two primary market objectives typically emerge. Price may subsequently sweep the **relative equal highs** to capture accumulated **buy-side liquidity**, or it may advance into a **premium** pricing zone to mitigate a **Sell-Side Imbalance** or **Buy-Side Inefficiency**. The latter refers to a **Fair Value Gap** where market delivery was imbalanced and requires re-equilibration.

TIMEMARK: 00:15:15,680

A Fair Value Gap (FVG) is observed positioned above the current market price. In anticipation of a potential rally towards this FVG, the trading framework would then focus on identifying an Optimal Trade Entry (OTE) within the advancing price action.

[Cont.]: The process involves identifying the first Fair Value Gap (FVG) that forms and subsequently reprices within the specific window of 2:00 to 3:00. This particular FVG often marks the inception of a significant price expansion, typically signaling an upward move from its origin point.

[Cont.]: This specific setup demonstrates a profit potential of at least 10 handles, with observations indicating a capacity for 12 handles or more. Consequently, this entry point is identified as a high-probability condition, highly conducive to a sustained price movement into [implied target].

[Cont.]: The market's objective was to resolve an inefficiency within the premium market structure and subsequently target existing bid-side liquidity. This precise execution led to a significant and favorable price run, which occurred specifically between 2:00 and 3:00.

[Cont.]: In conclusion, for individuals new to this channel who are encountering this specific content, it is important to recognize that you may not yet possess the foundational knowledge required to effectively implement this trading pattern. Therefore, acquiring the necessary prerequisite understanding is essential.

[Cont.]: Backtesting these concepts is crucial as you develop your ability to interpret price action. This practice will enable you to accurately determine the probable next draw on liquidity, forecasting the direction of the upcoming price swing.

[Cont.]: Do not be discouraged if the presented examples seem 'cherry-picked' or exceptionally tailored to a specific asset class you are trading. I have, in fact, traded and observed many instances of these exact setups across diverse market environments.

[Cont.]: Trading setups are disseminated through various methods. These include public announcements on Twitter or informal mentions made during live trade executions, which are concurrently recorded. This approach serves to illustrate specific patterns...

[Cont.]: Specific trading setups materialized, several of which I highlighted in real-time on Twitter last week. However, to my considerable disapproval, many of you proceeded to engage with these setups, a practice I explicitly discourage.

[Cont.]: It is crucial to understand that my intention was not to present a direct trade setup signal. Nevertheless, a considerable number of followers on my Twitter feed subsequently indicated that they executed the trade I previously discussed.

*[Cont.]: When effectively utilizing the **Silver Bullet** pattern, its operational efficacy is consistently demonstrated. This pattern exhibits exceptional consistency and offers an extremely high probability of success when specific confluence factors are present.*

[Cont.]: When specific factors are identified within price action, they establish a rule-based framework for discerning a time-based model. This methodology, therefore, effectively integrates both time and price into the analysis.

[Cont.]: As a mentor, my instruction and analytical concepts are fundamentally centered on enabling students to identify repeatable market patterns. This forms the core focus of my teaching methodology.

[Cont.]: This methodology offers a significant advantage: a dedicated 60-minute window of opportunity that consistently presents a high-probability trading setup every single trading day.

[Cont.]: During the initial stages of learning, particularly as new concepts and trading habits are forming within the ICT methodology, it is advisable not to track an extensive array of markets. Instead, concentrate on a maximum of one or two markets while developing your foundational understanding. This focused approach remains beneficial even as your trading expertise and market understanding develop.

[Cont.]: When focusing on a specific Point of Interest across a diverse range of markets—encompassing various currency pairs or Futures contracts—it becomes evident over time that...

[Cont.]: For a sustained and impactful trading career, your analytical focus should progressively narrow. The optimal number of primary setups or markets you actively pursue will ideally condense to one or two. While a maximum of three might be considered if a minor expansion of scope is desired, consistently operating beyond this focused range can be viewed as a deviation from the most disciplined and ultimately successful approach.

[Cont.]: My advice is to specialize. By concentrating on a single market, you will significantly enhance your ability to consistently identify and capitalize on one of the specific ICT Silver Bullet setups.

[Cont.]: Trading opportunities, or "setups," emerge every single day. By concentrating on just one market, traders can consistently identify these setups and generate their primary trading income.

[Cont.]: It is crucial to understand that losing trades are an inherent and unavoidable aspect of trading. Despite this reality, achieving sustainable profitability is entirely attainable. Significant opportunities can be leveraged by specializing in a singular market. However, if the anticipated setup does not materialize...

[Cont.]: During the London trading session, traders anticipate a specific high-probability setup, such as the Silver Bullet. The primary focus for this setup is initially within the morning (AM) session. Should the setup not materialize during the AM session, attention then shifts to its potential emergence in the afternoon (PM) session. This systematic approach is consistently applied across all markets, on every single trading day.

[Cont.]: Such specific trading opportunities will invariably present themselves. To effectively capitalize on them, traders must cultivate unwavering discipline and maintain sharp focus. It is crucial to diligently observe price action for the precise formation of these ideas or setups. Consistent application of this rigorous approach will lead to favorable outcomes.

[Cont.]: This particular concept necessitates no further investigation. There is no requirement to delve into alternative trading models or external teachings. The presented material is comprehensive, eliminating the need to seek additional instruction.

[Cont.]: Upon engaging with the educational content provided on this YouTube channel, you will develop the capacity for an independent mindset in your trading analysis. This foundational shift eliminates the reliance on conventional, often ineffective strategies, enabling your analytical framework to become distinctively your own.

[Cont.]: Ultimately, you will no longer need to seek external validation or information from sources, including myself or other mentors. Instead, you will cultivate profound self-trust, an inherently empowering quality that facilitates independent decision-making.

[Cont.]: Cultivating this optimal state of mind has consistently been my primary objective for all my students. I hope this session has provided you with valuable insights, and I look forward to our next discussion.

[Cont.]: It is imperative to prioritize disciplined risk management in all future trading activities. Always exercise caution and prudence when navigating the markets to safeguard your capital and ensure sustainable progress.
