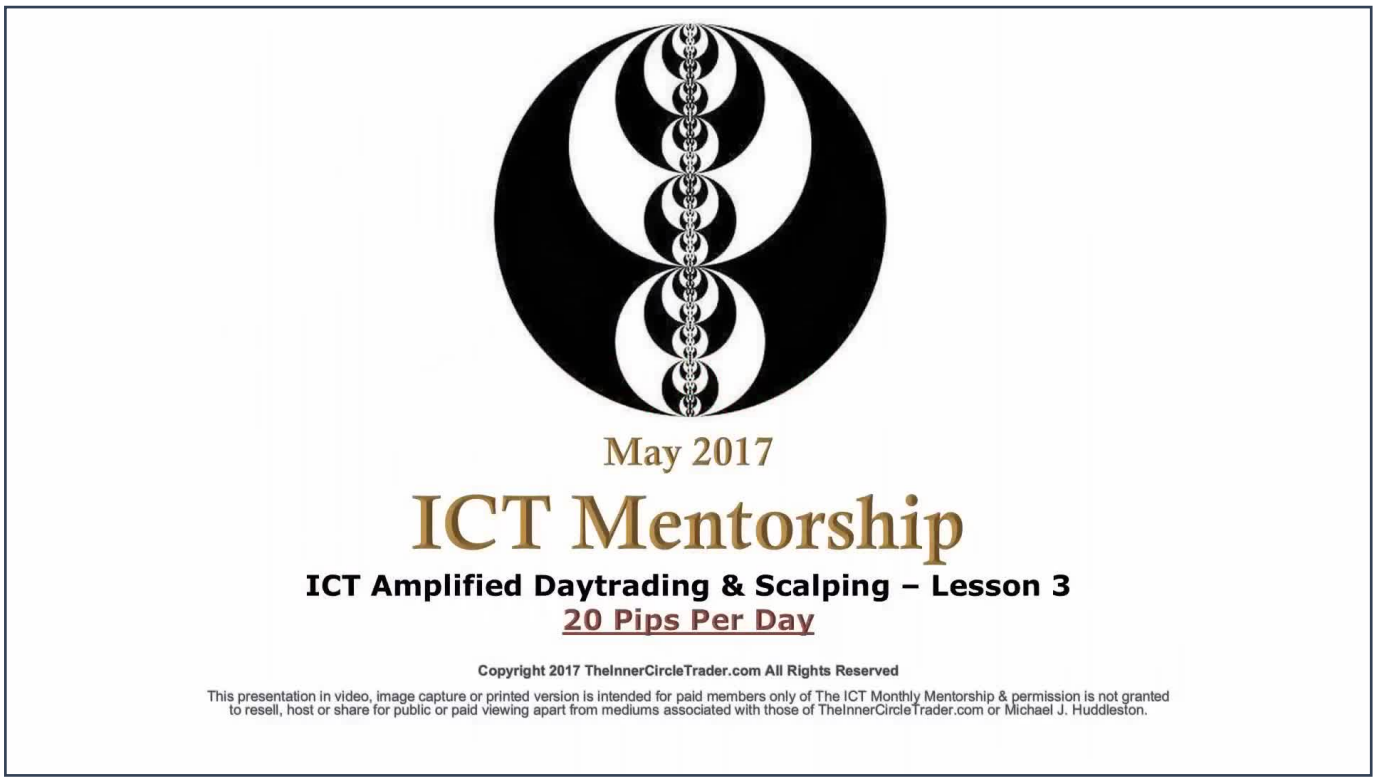
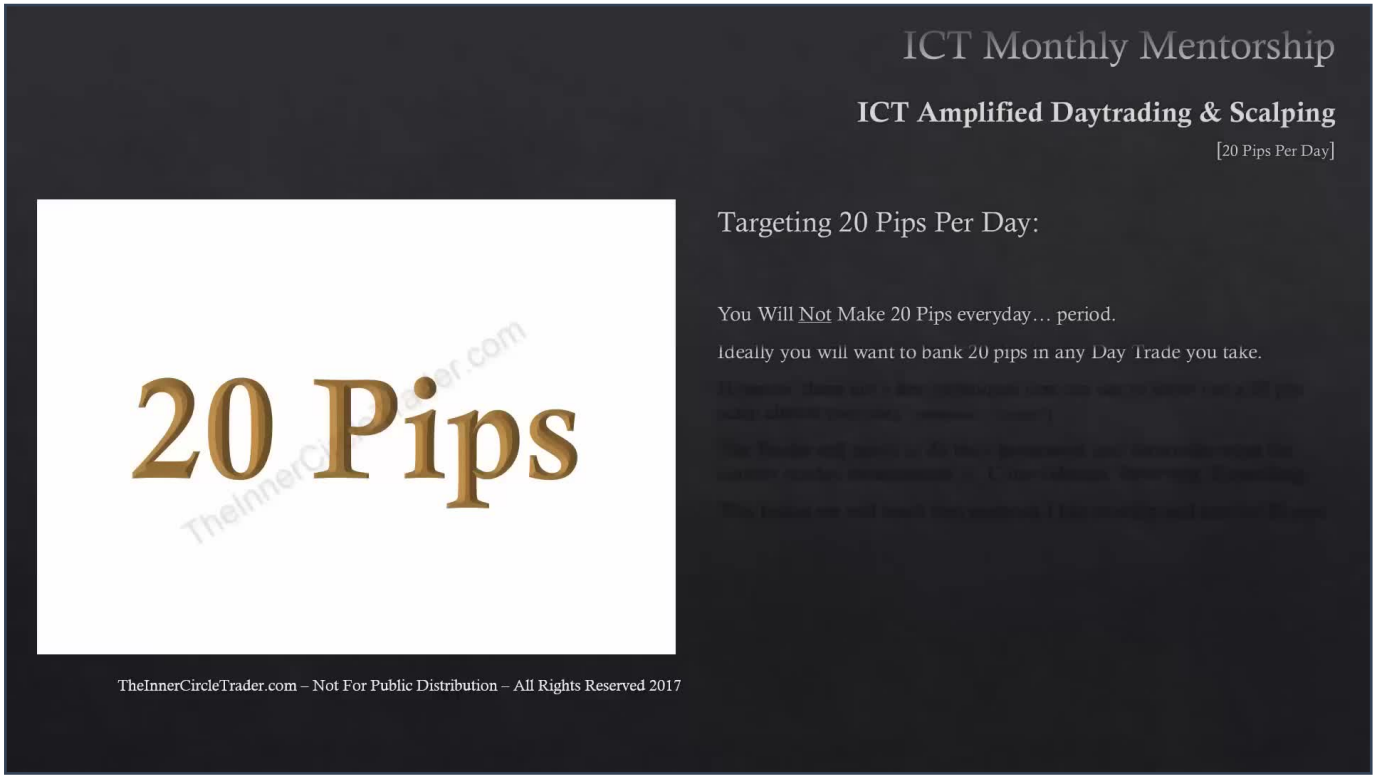
ICT MENTORSHIP CORE CONTENT

ICT MENTORSHIP CORE CONTENT - MONTH 09 - 20 PIPS PER DAY



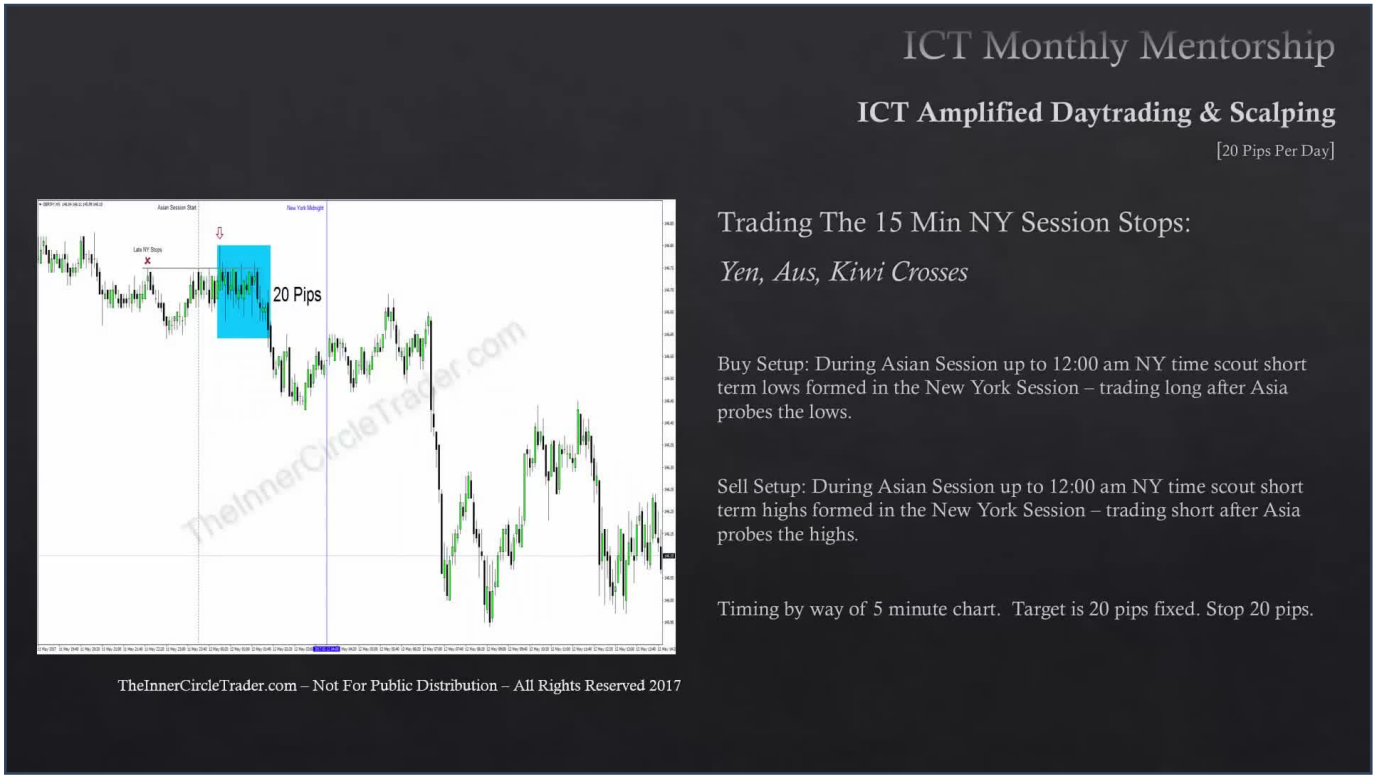
This lesson is the third in the 2017 ICT Mentorship, focusing on 'ICT Amplified Day Trading and Scalping: 20 Pips Per Day'. The objective is targeting 20 Pips per day. It is important to preface that you will not make 20 Pips every day; no one can promise that. Not every trading day offers the same opportunity; some days have more potential, others none at all. Traders must be mindful of this.



Ideally, aim to bank 20 Pips in any day trade. The surest way of banking 20 Pips for the day is to take profits at this level in every trade. While not advocating daily trading, if you do, always aim to bank something at 20 Pips. There are techniques to scalp 20 Pips 'almost' every day. The trader must do their homework to determine the current market environment, such as consolidation, reversing, or expanding. This is entirely about Market Profiling. This lesson will teach two methods to scalp with an aim for 20 Pips.

METHOD 1: ASIAN SESSION STOPS - OVERVIEW AND BUY SETUP

TIMESTAMP: 00:02:14



This method addresses how to trade the Asian session for those who need to, despite the lower volume compared to London and New York. This technique, or pattern, is a complete system.

- We are trading the 15-minute New York session stops.

- This pattern is good for Yen, Aussie, and Kiwi crosses.

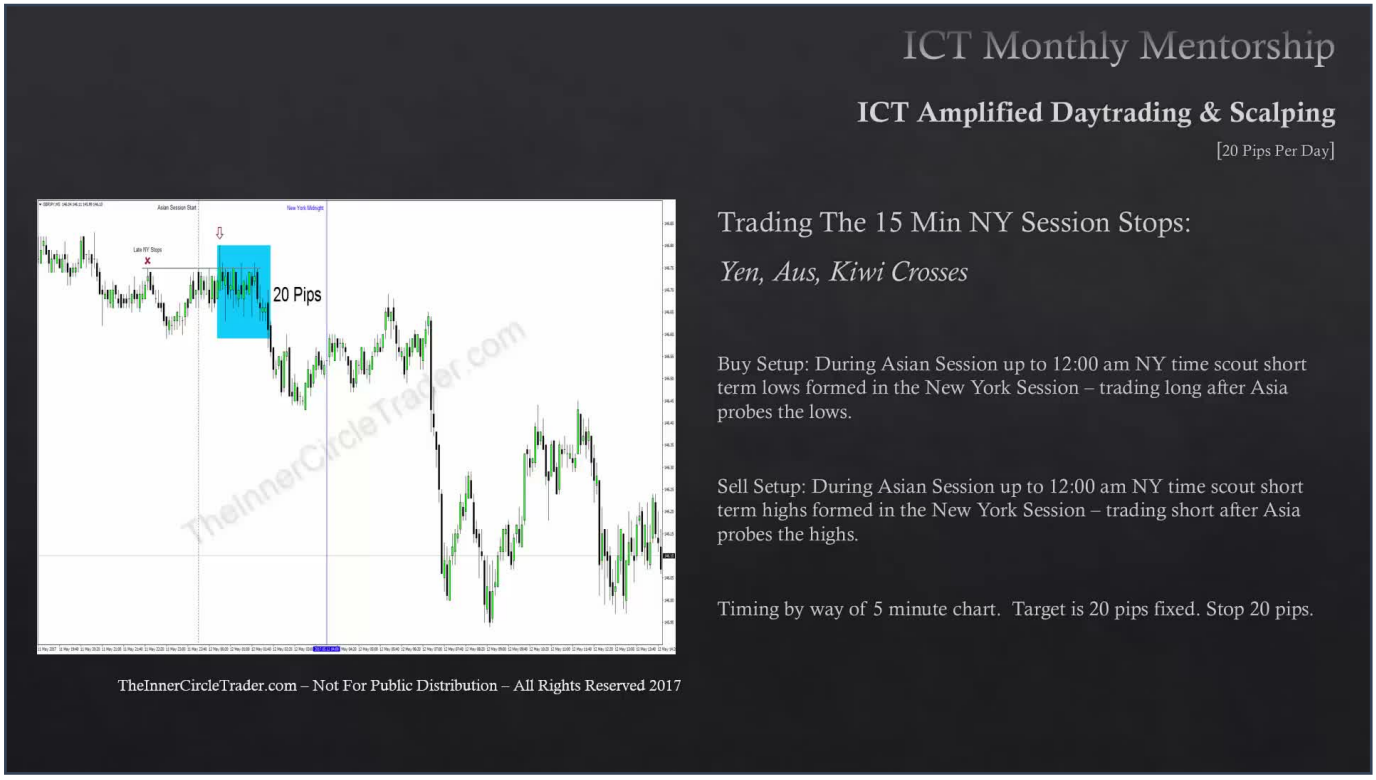
- The buy setup occurs during the Asian session, up to 12:00 a.m. New York time.

- You will scout short-term lows formed in the New York session. This typically refers to very late New York session, transitioning into the beginning of the New York crossover into Asia (or New Zealand and Aussie open).

- We trade long after Asia probes the low, essentially looking for a 'Turtle Soup long'.

METHOD 1: ASIAN SESSION STOPS - SELL SETUP AND TRADE PARAMETERS

TIMESTAMP: 00:04:36



The selling setup is during the Asian session, up to 12:00 a.m. New York time.

- We scout short-term highs formed in the New York session.

- We trade short after Asia probes these highs.

- Timing is off a five-minute chart.

- Targeting 20 Pips, which is a fixed target. No attempt to graduate or turn it into a massive profit.

- It's a straight 20 Pips target with a 20 Pips stop.

ASIAN SESSION STOPS - EXAMPLE: SHORT SETUP ABOVE LATE NEW YORK HIGHS

TIMESTAMP
00:05:09

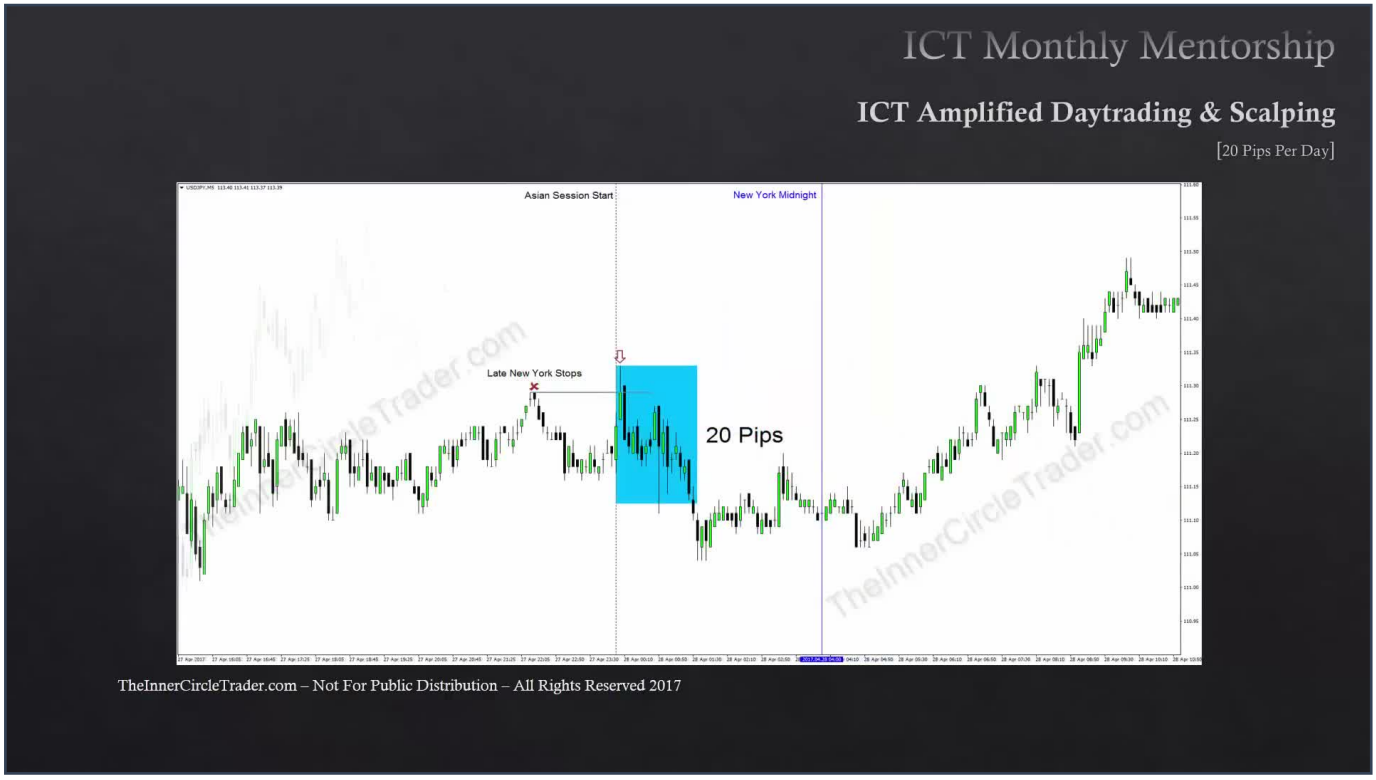
An example shows a short-term high formed prior to the Asian session start. This short-term high will have a small pocket of stops resting above it, delineated as 'late New York stops'. This is interpreted as a very low volume liquidity run, essentially defining the Asian Range High. If price trades above that short-term high (prior to the Asian session start) on a five-minute basis, we look to go short and take 20 Pips. The blue ranges in the video delineate what 20 Pips looks like, even if price moves further.

The setup usually occurs before New York midnight. We are trading inside the Asian range, expecting it to behave as it typically does: a consolidation. Many times, the Asian high forms after a short-term high is taken out. Once that high is taken out, they fade it and move price in the opposite direction, forming the Asian range. While the Asian range can often be larger than 20-40 Pips, it is many times at least enough to get 20 Pips out of it.

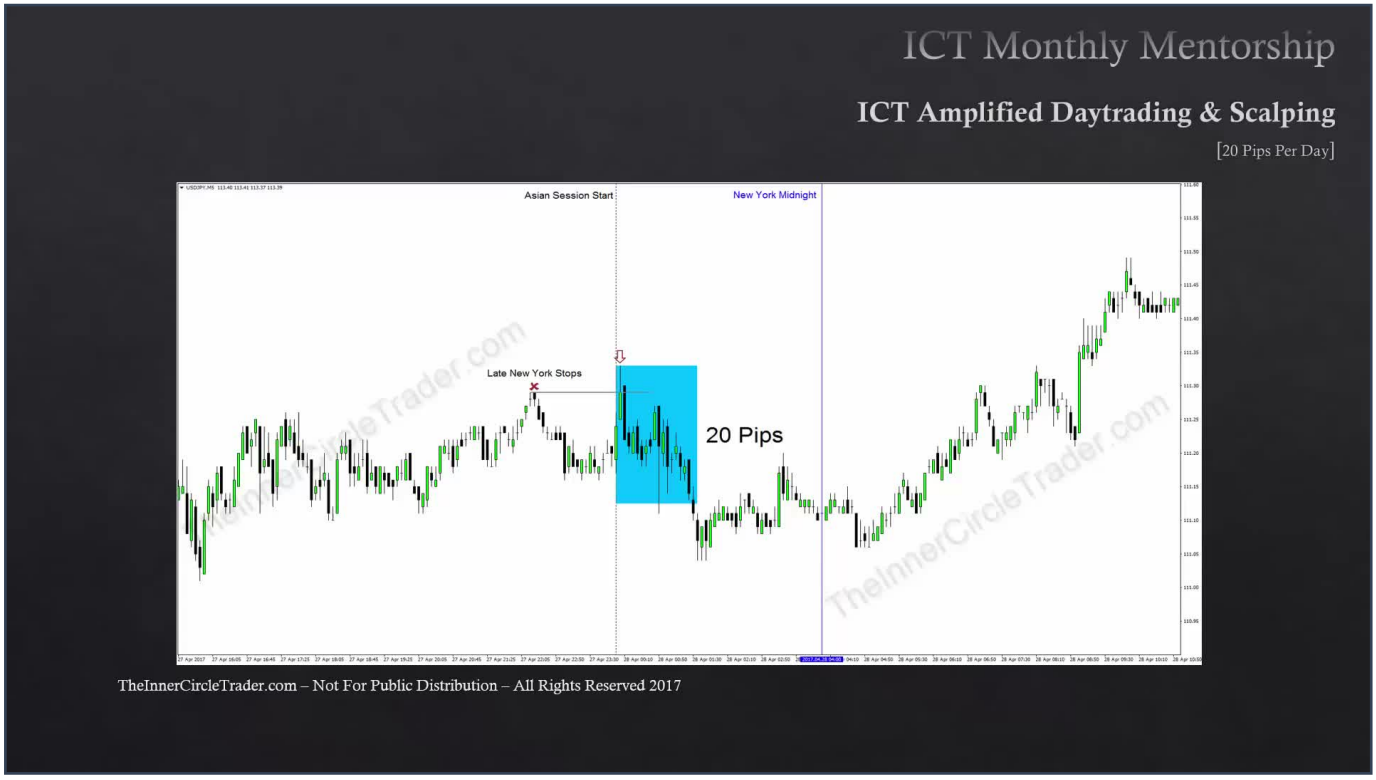
ASIAN SESSION - DOLLAR YEN SHORT EXAMPLE AND PD ARRAY CONTEXT

TIMESTAMP: 00:07:12

Another example with the Dollar Yen shows a short-term high where price trades above it during the Asian session. Fading this move yields 20 Pips before midnight during the defined Asian range. Between 8:00 p.m. New York time, a small rally is seen, which is then faded, allowing price to trade down 20 Pips. Looking at the far left of the chart, a fair value gap is visible, which price ultimately reached for, indicating more downside potential beyond the 20 Pips. This makes these Asian trades favorable, not for getting rich with 100 Pips, but for utilizing PD Matrix concepts (premium and discount) on lower timeframes.



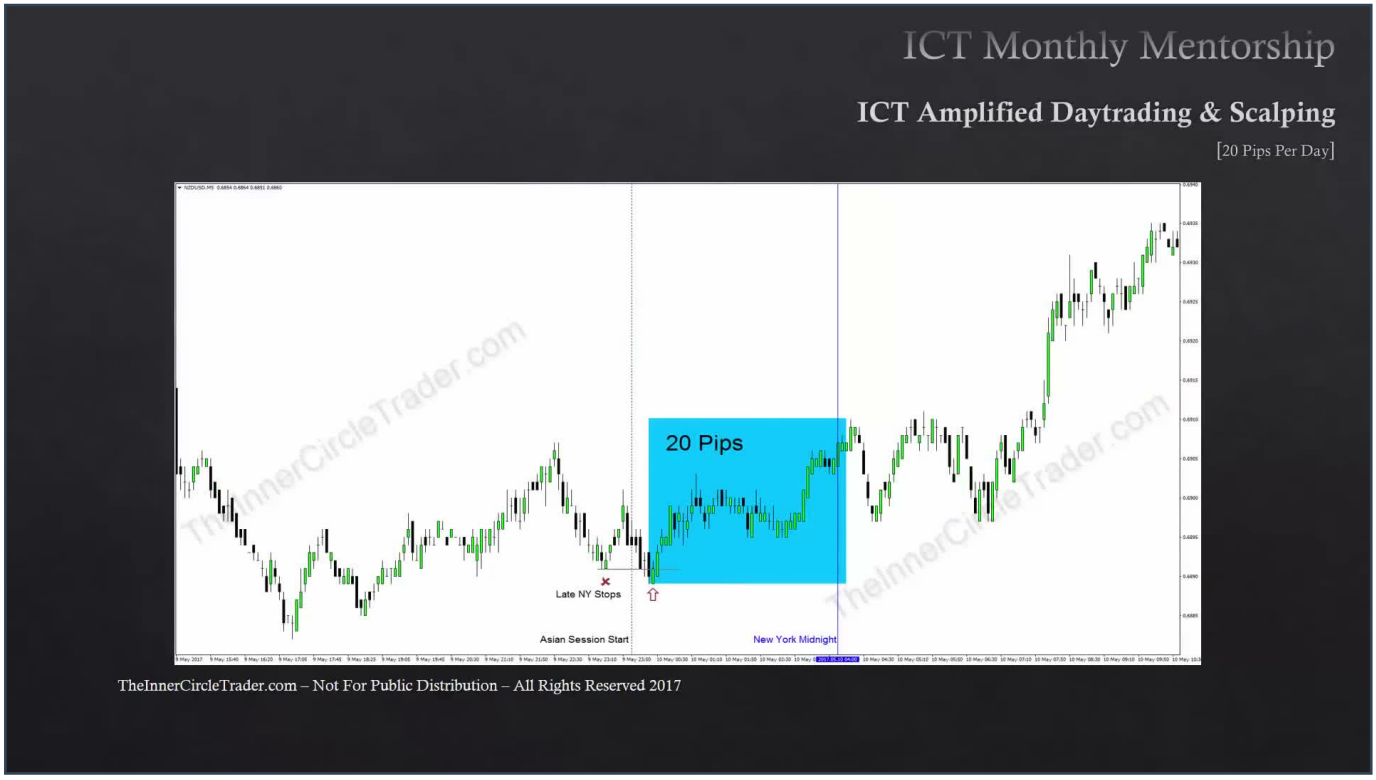
Another Dollar Yen example illustrates price trading above a short-term high in the Asian session. We anticipate consolidation, so there's nothing to fear. We are looking for the general sideways environment the Asian session creates. If price keeps running, your stop loss is fixed at 20 Pips, just like any other trade. This serves as a filter to prevent advanced losses. When trading above a short-term high, the entry is to sell short. The ideal entry is around five Pips above the short-term highs. Aggressive traders might enter one or two Pips above. If a five-Pip entry isn't available, miss the trade.



Another example shows a short-term high rallied above in the Asian session, creating the Asian range high. Price then fades this, yielding 20 Pips. Even if trades appear to continue on the upside or downside, the focus is on the initial 'whip' above a short-term high or below a short-term low. In market continuations, especially if bullish, selling above a short-term high works better. This is because you are pricing in the Asian Range High, and for upside movement, a Judas Swing down is expected. This allows for anticipating an Asian range that trades lower, potentially making a Judas Swing and delivering 20 Pips before price reverses higher for the day's close, without necessarily relying on a London session Judas Swing.

ASIAN SESSION - KIWI DOLLAR BUY EXAMPLE

TIMESTAMP: 00:11:00



An example with the Kiwi Dollar shows the beginning of the Asian session with a short-term low. Price trades down below this short-term low, probes it, takes out the liquidity below it, and then rallies up. The box represents 20 Pips, and price continues further. The objective is simply to find an opportunity to trade between 8:00 p.m. and midnight New York time.

METHOD 2: NEW YORK EXPANSION - INTRODUCTION

TIMESTAMP: 00:11:34

The second method for scalping 20 Pips involves trading the New York expansion. This pattern is universal and good for all currency pairs, without any specific favorite. It's universally applicable.

METHOD 2: NEW YORK EXPANSION - BUY SETUP

TIMESTAMP: 00:11:52

The buy setup occurs during the New York session, up to 10:00 a.m. New York time.

- We scout short-term lows formed in the New York open.

- Trading long after New York probes these lows.

- A key condition is that the London session has already posted the daily low, and the 5-day average daily range (ADR) is still pending (has not been filled for the day).

- Price has rallied from the London low, is retracing in New York, and trades down below a 5-minute short-term low.

- When this occurs, we buy long below that short-term low, with the mindset that it's a 'Turtle Soup' move, coming back for short-term sell stops, anticipating expansion towards the 5-day ADR.

METHOD 2: NEW YORK EXPANSION - SELL SETUP AND PARAMETERS

TIMESTAMP: 00:12:38

The sell setup is the opposite scenario, also during the New York session, up to 10:00 a.m. New York time.

- We scout short-term highs formed in the New York open.

- Trading short after New York probes these highs.

- London session must have posted the daily high (or is highly favorable of being the daily high), and the 5-day average daily range for that day is pending or yet to be fulfilled.

- New York session has a small retracement higher, trading above a 5-minute short-term high, taking out buy stops above a 5-minute swing high.

- The average daily range for the last 5 days' low has not been met yet. This is the condition for the trade.

- Timing is off a 5-minute chart.

- Targeting 20 Pips, fixed with a stop loss at 20 Pips.

NEW YORK EXPANSION - AUSSIE DOLLAR BUY EXAMPLE

TIMESTAMP: 00:13:44

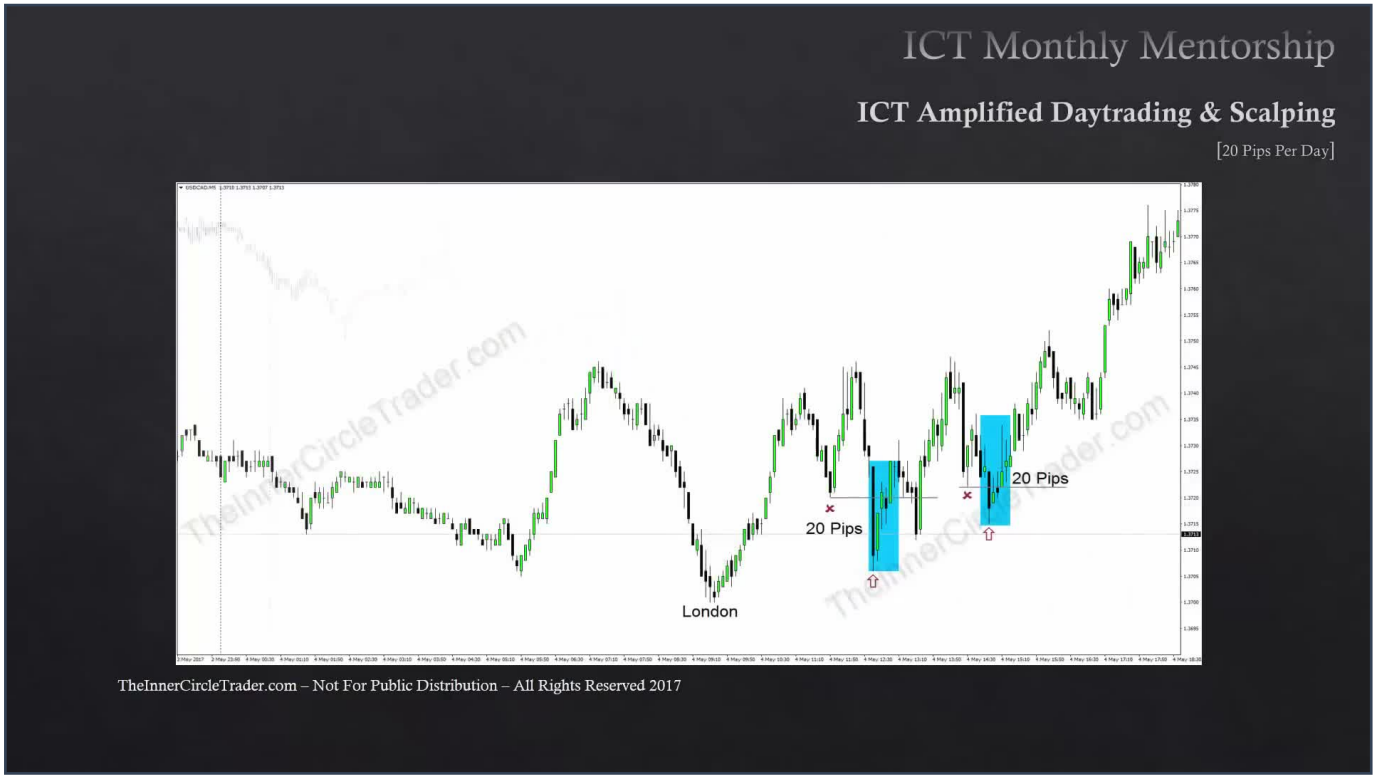
An example with the Aussie Dollar on a five-minute chart shows price making a low in London, followed by expansion and retracement. On the 5-minute chart, a short-term low is violated, and price trades back down into a 5-minute fair value gap and an order block. Price then expands well beyond 20 Pips. This specific pattern was the reason for anticipating a higher high for the Aussie Dollar during a live New York session.

NEW YORK EXPANSION - ADDITIONAL BUY EXAMPLE AND EURO DOLLAR SELL EXAMPLE

TIMESTAMP: 00:14:33

Another example shows London creating a potential low of the day, followed by upside expansion during the New York session. Price comes down below a 5-minute short-term low, quickly rejects, and goes up much more than 20 Pips (20 Pips shaded in blue).

- For the Euro Dollar, the London open creates the high of the day. Price trades down, and a retracement in the New York session comes back above a 5-minute short-term high for buy stops that have been trailed down. Once the short-term high is violated, selling short above it targets 20 Pips, which is easily achieved.

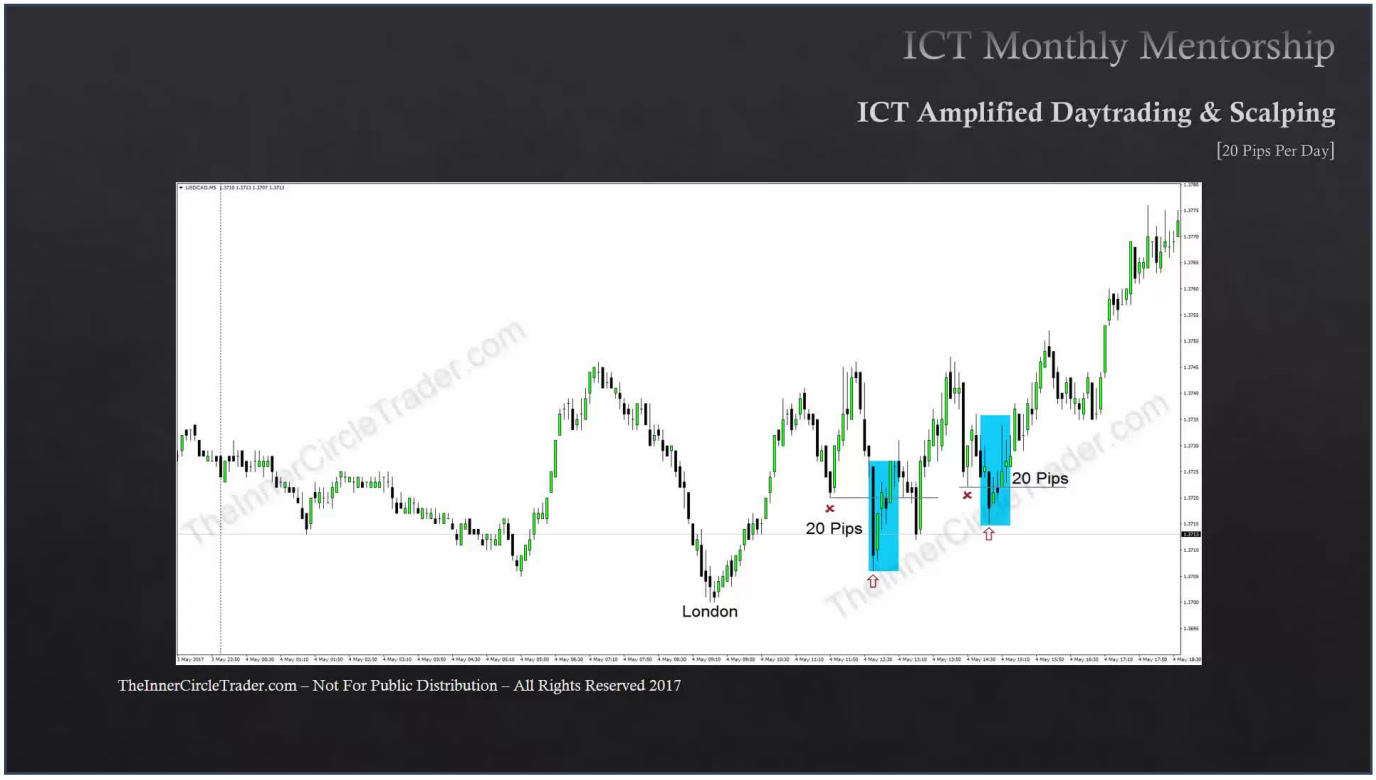


Sometimes, multiple setups can occur in the same trading day, even for a generally low-volatility pair like the Dollar CAD. Trading off a 5-minute chart offers this potential, especially on choppy days with later afternoon expansion.

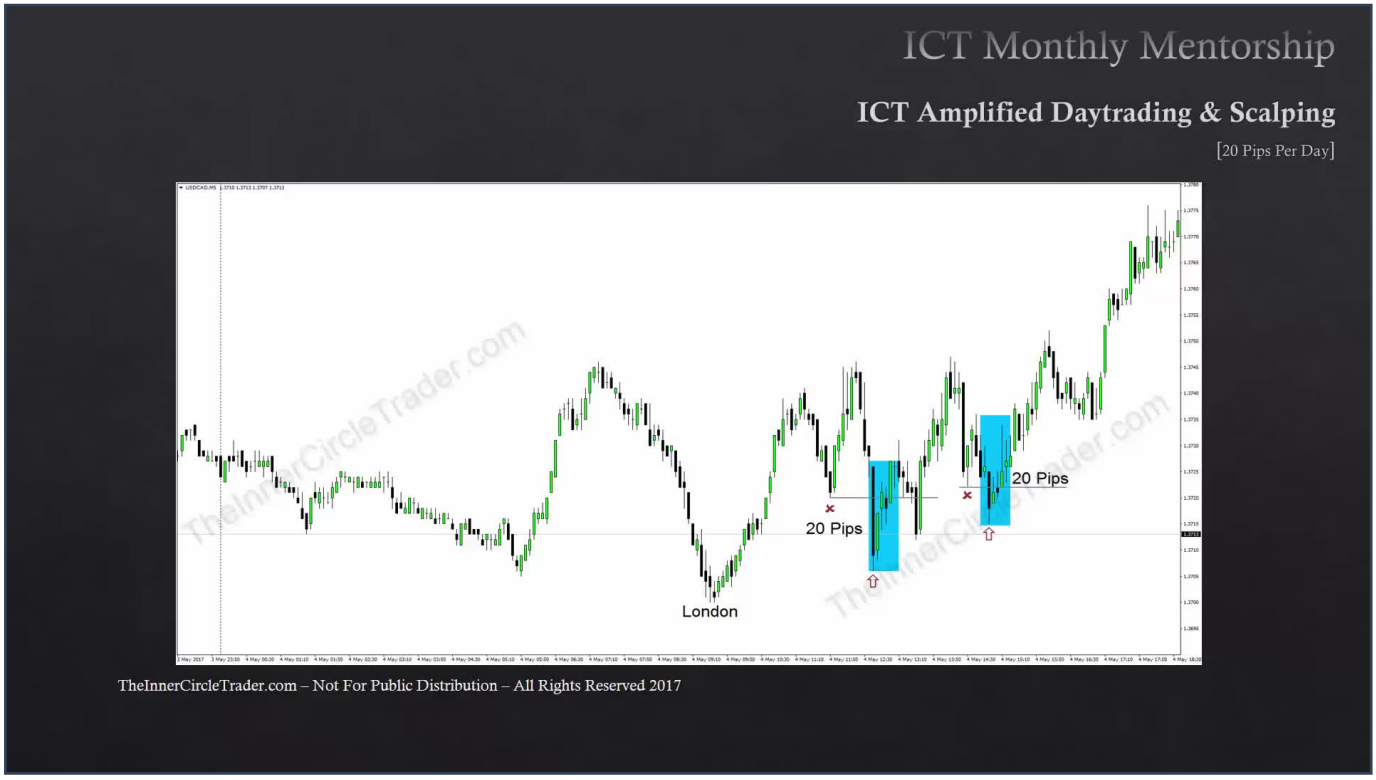
- Example 1: A London low forms, price expands, taking out an early Frankfurt high. Price then retraces, violates a 5-minute short-term low in the New York open, takes stops, and rallies 20 Pips.

- Example 2: A later opportunity occurs where another 5-minute low is violated, and price expands well beyond 20 Pips again.

The premise for these trades requires strong conviction about what London has already done and looking for that continuation in the New York session.



The ideal scenario is to look for a 5-minute low and allow price to break down below it. This entices short sellers and breakout artists, while also knocking out existing long positions that would profit from the next leg up. This pattern is a strict guideline for Forex, and also very effective for S&P (ES) trading, Dow futures, Triple Q's, and stock day trading on a 5-minute chart. It's a universal pattern applicable to commodities, bonds, and other instruments.



These two concepts provide a more focused approach for finding short-term intraday opportunities. While not always present, by reviewing a large number of pairs (10-15), such setups can be found almost every trading day for practice. The emphasis is on 'practice' to avoid thinking one can day trade every single day for 20 Pips, but rather to identify such panning-out opportunities daily across various pairs.
